## 1. Introduction

Autodesk Fusion 360 Manage brings powerful product lifecycle management tools to web browsers and mobile devices through Autodesk's cloud computing platform. Autodesk Fusion 360 Manage provides customers with an integrated and intuitive set of tools for building custom security policies that match the needs of their organization.

As a secure, cloud-based product, Fusion 360 Manage offers the benefits of collaboration across a product's lifecycle while safeguarding customer data. The Fusion 360 Manage application is designed and built using robust cloud software practices and powered by Amazon Web Services (AWS), a leader in cloud infrastructure. Autodesk has designed our services to be scalable and secure, to ensure a resilient and safe application.

### 1.1 Document Purpose

The purpose of this document is to outline Autodesk's security framework and information security standards and practices with focus on Fusion 360 Manage, and to explain its multi-tenant live production environment.

## 2. Autodesk Security

The Autodesk security framework is based upon industry standards to ensure consistent security practices, enabling us to build secure, run secure, and stay secure.

**Build secure** – Embedding security into our products from the ground up is a critical part of securing our customers' investment in Autodesk products and services. We integrate security into all phases of software development.

**Run secure** – We build security directly into our infrastructure. Our holistic approach includes deployment of endpoint protection tools, standardized patching and hardening requirements, identity and access management controls, and offensive security activities.

**Stay secure** – Security at Autodesk is focused on three core objectives that protect the confidentiality, integrity, and availability (CIA) of information:

- Confidentiality: Information is accessible only to authorized persons
- Integrity: Information is complete and accurate
- Availability: Data is accessible and available to customers

The Chief Security Officer (CSO) is accountable for the development, implementation, and governance of the security strategy and program and ensures that security policies and standards are applied across all Autodesk products and environments. The CSO and security team are supported by Autodesk executives and Board of Directors.

## 3. Human Resources Security

Autodesk employees are required to follow the company's Code of Conduct, which requires every employee to conduct business lawfully, ethically, with integrity, and with respect for each other and the company's users, partners, and competitors. Per the Acceptable Use Policy, employees must protect the security, confidentiality, integrity, and availability of Autodesk and customer information.

Autodesk security is also supported through an internal information security awareness program, implemented through appropriate role-based training. Employees with privileged role(s) and access (e.g., cloud operation teams) are required to take additional role-specific training to ensure protection of customer data through cloud services.

Where permitted by law, background checks are required for employees with access to the computing resources and support systems used by the Autodesk teams.

## 4. Access Management

Autodesk restricts access to information and systems based upon business and security requirements to prevent unauthorized access. Access is granted using the principles of least-privilege and need-to-know basis. Formal processes are documented for user provisioning, registration, and de-provisioning. Privileged access is restricted and requires additional management approvals.

Multi-factor authentication (MFA) is required for access to services, network and systems, production environments, and access to the internal Autodesk network. Access to software source code and production environments is restricted and aligned with business, security, and privacy requirements.

### 4.1 Fusion 360 Manage Application Controls

Fusion 360 Manage allows designated customer administrative users to create detailed identity and access management policies to align with their business needs. Customer non-administrative users can manage ownership of their workspace items and set sharing permissions on their reports.

### 4.2 Authentication

Users authenticate to the service using Autodesk Accounts, which enforces encryption in transit via HTTPS and SSL and requires that each customer user has a unique email and password for authentication. Customers may also choose to enable multi-factor authentication or integrate with Autodesk SSO based on the SAML 2.0 and OAuth 2.0 standards to give administrators the ability to enforce certain security and access requirements through their preferred identify provider, such as Microsoft's Azure Active Directory and ADFS, Okta, OneLogin and more.

### 4.3 Provisioning Users

Customer administrative users can add and deactivate users and delegate administrative authority to other users.

### 4.4 User Group and Role-Based Security

Fusion 360 Manage roles allow customer administrative users to customize access control levels to match the job responsibilities defined within their organizations. Roles are based on a set of permissions to data and functionality that correspond to a particular job function. Once a role is created, it can be associated with a user group so that users within the group are granted the role's permissions by default. The existence of roles and user groups in Fusion 360 Manage enforces the principle of least privilege, by ensuring each user's access to data and functionality is limited to only what is needed for the completion of assigned tasks.

### 4.5 Accessing Account Security Information

Fusion 360 Manage customer administrative users can view necessary account security information, including group membership, workspace permissions assigned to users, and revision control settings.

### 4.6 Monitoring and Auditing User Activity

Fusion 360 Manage provides detailed activity logs, which are available to customer administrative users. Activity logs include information about the actions performed by users, including workspace item modifications, workflow actions, and logins.

## 5. Asset Management

Asset management and protection begins with maintaining an inventory of assets with correlated roles (e.g., owners, custodians) and responsibilities for all assets. Autodesk assets inventory includes the name of the asset owner in an Autodesk managed Asset Management System. Assets are classified based on several criteria, such as asset value and importance, business criticality, implementation environment, and associated security and privacy requirements. Inventory of assets recognizes the context of systems that process, transmit, or store customer information.

Formal rules are defined for acceptable use of information assets and handling of assets throughout the assets' lifecycle.

## 6. Cyber Security Risk Management

Autodesk's cyber security risk program considers information security risks as operational risks, defined by the occurrence of any threat event that could compromise Autodesk assets (i.e., unauthorized use, loss, damage, disclosure, or modification of assets) for the profit, personal interest, or political interest of individuals, groups, or other entities, or because of accidental wrongdoing. Risk assessment in Autodesk is a continuous process of risk evaluation and subsequent implementation of controls or actions to limit and maintain the risk to an acceptable level. Autodesk's Cyber Security Risk Management program consists of the following elements: risk assessment, risk treatment, and risk monitoring and communication.

An overall risk assessment is performed at least annually, or when new risks are introduced or identified. Continuous monitoring and remediations are performed for high and critical risks identified. Risk assessments are performed by Autodesk's security team, and assessment results are presented regularly to relevant business stakeholders and Autodesk's board of directors. Autodesk's Cyber Security Risk Management methodology follows industry standards and frameworks and includes the following steps: prepare for assessment, conduct assessment, communicate assessment results, and maintain and monitor risk.

## 7. Data Classification, Management, and Protection

Autodesk implements controls to manage and protect the end-to-end information lifecycle, from creation/acquisition to retention and deletion. Autodesk considers highly sensitive information such as sensitive personal information, other customer sensitive information and intellectual property as confidentially restricted information. Security requirements for confidentially restricted information include:

- Strong authentication and access restrictions based on business need-to-know principles to authorized individuals
- Encryption of data in transit and at rest
- Secure storage
- Defined backup procedures, retention periods, integrity checks, and destruction procedures

Customer data and records stored in the Fusion 360 Manage platform are retained per applicable product terms of use and contractual requirements.

## 8. Cryptography

Cryptographic controls are implemented to ensure the protection of confidentiality, integrity, and authenticity of information.

Autodesk key management controls define the requirements for the use, protection, and lifetime of cryptographic keys and keying material. Cryptographic key management activities are performed by authorized Autodesk employees who adhere to relevant policies.

## 8.1 Fusion 360 Manage Cryptographic Practices

Fusion 360 Manage implements cryptographic algorithms based on industry best practices and standards. Information is protected with the most efficient cryptographic controls, taking into consideration the state of the information (i.e., in transit or at rest) and the system or a system component which processes, transmits, or stores information.

Fusion 360 Manage implements cryptographic mechanisms for inbound and outbound data flows. All customer data is encrypted in transit and at rest:

- Encryption in transit: TLS v1.2 (min.)
- Encryption at rest: AES-256 (Database, Backups, etc.)

## 9. Secure Software Development and Change Management

Secure design, coding, testing, and maintenance processes are integrated into Autodesk's secure software development lifecycle methodology. During the design stage, Autodesk creates detailed design documents and threat models, which are reviewed and approved by security architecture experts to assess functionality, scalability, security, and performance. Software engineers and architects perform peer reviews to detect deviations from secure development practices and maximize code quality. An integral part of the secure development process also includes Static Application Security Testing (SAST), Dynamic Application Security Testing (DAST), and third-party library scanning. Penetration tests are performed at least once a year by an external vendor.

Functional and acceptance testing programs include manual and automated techniques to check that services are developed on predefined and testable criteria.

Performance testing is also integrated into the development lifecycle. Autodesk's quality assurance team conducts load tests throughout the development cycle to identify changes that negatively affect performance as early in the process as possible.

The cloud operations team is responsible for defining and executing procedures for software release management, roll-back plans, system upgrades, system health monitoring, and other activities required for the operational monitoring and maintenance of Autodesk products. Change management policies define release requirements to provide traceability for production software changes. The change management procedure ensures that all organizational and operational processes and information-processing changes are controlled, documented, and approved.

Autodesk practices continuous delivery of code into production through multiple environments: development, testing, and production. These environments are segregated to mitigate the risks of unauthorized access or changes to the production environment.

## 10. Operations Security, Vulnerability, and Patch Management

Secure operational procedures and responsibilities are implemented to protect the processing and storage of customer information.

Security non-negotiables require the implementation of security controls for each system component (e.g., server, database, network device, service, etc.) taking into consideration the classification of information processed, transmitted, or stored. Systems and services are continuously monitored, scanned, and tested to validate the correct operation of security controls. Standard system hardening requirements are enforced through configuration and vulnerability scanning activities.

Information about technical vulnerabilities is continuously monitored and processed in a timely manner. Vulnerability identification methods include automated vulnerability scanners, penetration testing, bug bounty programs, and gathering of threat intelligence. All production systems and system components are in scope of the vulnerability management process.

Identified vulnerabilities are evaluated and appropriate measures are taken to remediate identified risks. The priority of vulnerability remediation is determined by a combination of the vulnerability severity score corresponding to CVSS (Common Vulnerability Scoring System) v3, exploitability, exposure, and existing compensating controls.

Remediation methods for all in-scope systems and components include patch management, software change, or implementation of compensating controls. Continuous and automated patching is performed.

## 10.1 Fusion 360 Manage Operational Controls

In addition to the above-described controls, Fusion 360 Manage has implemented the following operational security controls:

**Hardening:** All system and application infrastructure components are hardened.

**Web Application Firewall (WAF):** WAF is configured and enabled to protect against common web application attacks.

**Anti-malware controls:** Advanced anti-malware and anti-virus technical controls are implemented across environments and are combined with operational controls such as Security Awareness Training to increase awareness of malware threats across all employees and users.

**Intrusion detection and prevention:** Alerts from intrusion detection systems are monitored and investigated for any unusual or suspicious behavior; when alert investigation results in a suspect on true positive alert, Autodesk's Incident Response process is triggered.

**Threat intelligence:** Threat intelligence sources are regularly reviewed and evaluated for applicability in products; applicable threats are prioritized in accordance with the risk level.

## 11. Fusion 360 Manage High Availability and Clustering

Fusion 360 Manage is designed to achieve a high level of availability by employing redundant systems in its supporting infrastructure and distributing load across auto-scalable instances. Clustering technology keeps Fusion 360 Manage highly available by limiting single points of failure and directing service requests away from instances that are highly utilized. Performance and load tests are executed throughout the software development lifecycle, and all services are monitored for resource usage (e.g., CPU, memory, storage), DB operation performance, and liveness probes. Automated compensating behaviors and alerts are triggered in cases where the threshold is reached, and action is needed.

As patches and upgrades are applied to the production environment, a rolling deployment approach is taken for Fusion 360 Manage whenever possible, aiming to limit downtime of the service. Changes that may affect service availability are scheduled as maintenance windows and announced to customers in advance (48 hours) and contain information regarding description, impact, and duration of the scheduled maintenance.

## 12. Network Security

Network security management processes and controls ensure the protection of information in networks and supporting information processing components. Network security is enforced using a combination of physical and logical controls, including encryption, firewalls, and systems-hardening procedures. Necessary and approved network traffic is allowed into different segments of the network.

## 13. Backup and Recovery

Backup copies of information, software, and system images are taken and tested regularly in accordance with Autodesk's backup strategy and policies to protect against the loss of data. Backup policies define the frequency of creating backups, appropriate security controls, and retention periods, based on the classification of the data. After the expiry of the backup retention period, information is securely disposed.

Backups are encrypted at rest and access is restricted to privileged users. Recovery testing is periodically conducted to validate the integrity of backup data and to verify the duration of the recovery process.

## 14. Fusion 360 Manage Data Replication

Replication of customer data is performed between AWS Availability Zones (AZs). Replication limits the possibility of data loss or a delay in service resumption if fail-over to another zone is required.

All customer data submitted to Fusion 360 Manage, up to the last committed transaction, is automatically replicated on a near real-time basis to a secondary availability zone. Databases are backed up daily and stored to a secondary AWS region, after which they are securely disposed.

## 15. Logging and Monitoring

Production systems and applications are configured to log events and activities to support automated event correlation and analysis. Logs are protected against tampering and unauthorized access with special attention to administrator access and operator logs. An audit trail is established for all relevant user-system interactions. Security Information and Event Management (SIEM) software is used by the Security Operations Center (SOC) team to monitor, detect, and respond to security or privacy alerts.

The retention period of logging records is kept according to business and regulatory requirements.

## 16. Incident Response

Autodesk implements a security incident response process to consistently detect, respond, and report incidents, minimize data loss mitigate risks, and restore information system functionality and service continuity as soon as possible.

Autodesk has a documented Security Incident Response Process (SIRP) to effectively manage security incidents. Roles, responsibilities, and procedures are established to ensure a timely and efficient response to potential security or privacy-related incidents. All employees and external parties are required to report any observed or suspected security events in systems or services.

The incident response process includes:

- Continuous monitoring of threats and alerts
- Establishment of an information security incident response team
- Establishment of clear procedures for identifying, responding, assessing, analyzing, and follow-up of information security incidents
- Facilitation of clear communication of security incidents with internal and stakeholders
- Continuous improvement from information security incidents to reduce the probability or impact of future incidents

The SIRP is periodically reviewed and evaluated for effectiveness. The incident response process is tested annually to assess the effectiveness of the process and training of security incident response stakeholders.

## 17. Business Continuity and Disaster Recovery

Autodesk's Business Continuity and Disaster Recovery (BCDR) program establishes processes and procedures to recover critical products, including Fusion 360 Manage, following a disruption resulting from a crisis or a disaster situation.

Processes, activities, and resources are defined by performing a Business Impact Analysis (BIA), which identifies critical business processes, services and activities, and key resources necessary for operating that process, service, or activity.

BCDR scenarios, teams, and roles are documented as a Business Continuity Plan (BCP). Events that would initiate this plan include natural disasters, political disturbances, man-made disasters, external human threats, and internal malicious activities.

The BCP is tested annually; BCP test exercises include tabletop and simulation/technical testing.

BCP testing is performed to maximize the effectiveness of contingency operations through an established plan in following phases:

- Notification phase to detect and assess damage
- Activation phase to respond to the damage and activate the plan
- Recovery phase to restore temporary operations and recover damage done to the original system

## 18. Third Party Security and Vendor Risk Management

Autodesk has a third-party risk assessment process to evaluate and identify security, privacy, and compliance risks before doing business with third party providers that have access to customer information. Autodesk requests our third-party providers to adopt the changes recommended from the risk assessment to improve their security posture. Compliance with this process is mandatory for all business and product teams across Autodesk.

The process establishes operational requirements to manage identification, assessment, monitoring, reporting, and remediation of risks posed by Autodesk's third parties and vendors. The Security team conducts the assessments, reports identified risk to business owners, and tracks third party security risk remediation activities.

## 19. Compliance

Autodesk assesses its compliance against data protection and information security standards on a regular basis. Autodesk implements security policies based on industry best practices and regularly conducts internal and external audits, attestations, and certifications. Management of information security and the implementation of related processes, policies, and procedures are independently reviewed and audited periodically or when significant changes relevant to security and privacy domains occur. Reviews and audits also include technical inspections to assess the effectiveness of controls to ensure compliance with compliance frameworks, regulatory requirements, or contractual requirements.

Autodesk has selected industry standard attestations and certifications for our products. To learn more please visit the Compliance section of the [Autodesk Trust Center](#).

## 20. Privacy

Legal requirements related to privacy and protection of personal data are continuously monitored and implemented across Autodesk's operations.

Autodesk is transparent about how customers' personal data is collected and used. Read the [Autodesk Privacy Statement](#) to learn more.

## 21. Additional Resources

The following resources provide general information about Autodesk and other topics referenced in the main section of this document.
